ABSTRACT:

PROBLEM TO BE SOLVED: To allow an air conditioner case to be maintained in an anti-bacterial and mildewproofing state for a long period in an air conditioner for a vehicle having the case formed with a air channel and an air conditioning member arranged in the channel and arranging an anti-bacterial and mildewproofing agent having volatility in the case.

SOLUTION: The anti-bacterial and mildewproofing agent 13 arranged in the air conditioner case 3 is provided so as to avoid a contact with wind flowing from an upstream. Even when the agent 13 is arranged at a position not brought into contact with the wind flowing from the upstream, or even when the agent is housed in a case having a closed surface and an open surface and the closed surface of the case is directed to the upstream and arranged in the channel 2, or arranged on the downstream of the door. The wind is not brought into contact with the agent 13 during the operation of the air conditioner so that its volatility is not expedited, and hence the lifetime of the agent can be prolonged as compared with that of a prior art.
